BILANCIATURA

BALANCING & UNBALANCING

Definizione di "Bilanciatura" - Definition of "Balancing"

Un solido che ruota intorno al proprio asse genera forze centrifughe su tutte le masse coinvolte.

Se le masse in rotazione sono distribuite in modo simmetrico rispetto all'asse, le forze generate nella direzione opposta si annullano, evitando l'insorgere di vibrazioni, in questo caso il sistema è bilanciato.

Diversamente, la disomogenea distribuzione delle masse in rotazione produrrà uno sbilanciamento delle forze, causa di vibrazioni dannose per la macchina utensile, l'utensile e le superfici lavorate.

L'operazione di bilanciatura, quindi, redistribuisce in modo omogeneo le masse di un solido in rotazione.

If the rotor(tool holder) is rotated around the axis, centrifugal forces generate in all parts. If these centrifugal forces are distributed symmetrically against the rotation axis, the centrifugal forces generating in the opposite direction are offset by one another, resulting in no forces to the rotation axis eventually. Therefore bearings are not vibrated. In this case tool holder is in the balanced state. On the contrary, if centrifugal forces are distributed asymmetrically against the rotation axis, or if the force of one part is greater than that of the opposite part, the forces equivalent to differences are added to the rotation axis, causing the rotor(tool holder) to vibrate. The imbalance of distribution of rotor mass is called "Unbalance". In other words, "Unbalance" is mass existing unevenly in the rotor(tool holder).

Grado di "Bilanciatura" secondo la normativa ISO 1940

Balancing Grade Quality According To ISO 1940

$$U = \frac{G \times M}{\text{Giri}} \times 9549 = (g \times mm)$$

G : Grado di Bilanciatura

M : Massa del rotore (Kg)

9549 : Numero fisso

U : Sbilanciamento residuo (g x mm)

Giri : (giri/min)

Vantaggi della "Bilanciatura" - Merits of "Balanced Machining"

I centri di lavoro di ultima generazione, oggi sempre più sofisticati, consentono lavorazioni ad elevato numero di giri rispetto al passato, e richiedono una maggiore stabilità del sistema.

Nelle lavorazioni ad elevato numero di giri, l'insorgere di vibrazioni è la principale causa di riduzione delle performance.

Queste ultime sono responsabili di cattive finiture superficiali, usure precoci degli utensili e, in alcuni casi, del danneggiamento dei cuscinetti delle macchine utensili.

La bilanciatura, quindi, è fondamentale per prevenire l'insorgere di questi fenomeni. La YG1 costruisce mandrini con vari tipi di bilanciatura per soddisfare tutte le esigenze applicative.

Recently, rotating machines are more sophisticated and operated at high speed with the technical advance. Also, they require more efficiency and more stable functions which are stricter conditions than ever before. In high speed machining, one of the largest factors which degrade performance of machines is chattering. It causes workers to suffer displeasure, noise, and fatigue which are main problems affecting productivity. Balancing of the rotor(tool holder) is the essential and effective factor in order to prevent vibration of the machine. It is widely recognized as the indispensable process in manufacturing rotation machinery.

YG1 manufactures tool holders with various balancing grades meeting the needs of users.

- **Assemblaggio:** Posizionare l'utensile nella bussola e successivamente inserire la bussola con l'utensile nel mandrino.
- **Chucking Method:** Please assemble cutting tool with collet firstly, and then insert collet into Hydraulic Chuck.
- **Caratteristica:** La pinza è divisa in tre sezioni per garantire un diametro presa utensile più preciso e una maggiore forza di serraggio.
- **Feature:** HK Hydraulic Chuck collet (reduction sleeve) is cut into trisection by high precision cutting to guarantee precise I.D and strong clamping power.

INFORMAZIONI TECNICHE

TECHNICAL INFORMATION

Alta precisione del foro d1

Run-out: ≤ 0.003 (mm)

High Precision I.D

Run-out: ≤ 0.003 mm

- Accuratezza del foro 0.003 (mm)
- Less than 0.003mm of Tool Holder accuracy at I.D.

Grande forza di serraggio

Strong and Consistent Torque Power

- Maggior forza di serraggio ottenuta grazie al contatto diretto tra l'utensile e mandrino.
- Achieving strong torque power by integration of chuck and tool.

Lavorazioni con sporgenze elevate

Deep hole Machining

APPLICAZIONI - APPLICATION

MONTAGGIO E SMONTAGGIO - ASSEMBLING & DISASSEMBLING

• Montaggio

Introdurre la pinza nella ghiera di serraggio dal lato del riferimento (cerchio rosso), accoppiando la scanalatura con le sedi della ghiera (cerchio verde). Spingere, ruotando nel senso della freccia (fig 1), fino allo scatto della pinza in posizione. (fig 2)

Attenzione, la pinza deve sempre essere montata completamente nella ghiera prima di avvitare quest'ultima sul mandrino.

• Assembling

Insert groove of collet into eccentric ring of the clamping nut at the mark on the bottom of the nut. Push collet in the direction of the arrow until it clicks in place. Screw nut with collet onto toolholder. We recommend tightening the nut with a torque wrench.

• Smontaggio

Tenere ferma la ghiera ed esercitare una pressione laterale sulla parte posteriore della pinza verso il riferimento (cerchio rosso), liberando dall'accoppiamento i due pezzi. (fig 3)

• Disassembling

After the nut is unscrewed from the toolholder, press on the face of the collet while simultaneously pushing sideways on the back of the collet opposite the mark until it disengages from the clamping nut.

MONTAGGIO E SMONTAGGIO - ASSEMBLING & DISASSEMBLING

• Per un corretto posizionamento dell'utensile nella pinza, è consigliabile utilizzare tutta la lunghezza di presa disponibile, in caso di necessità non utilizzarne mai meno dei 2/3.

Non serrare mai la pinza nel mandrino senza l'utensile, oppure con utensile con gambo minorato o maggiorato rispetto al range di presa.

• For a correct positioning of the tool in the collet it is advisable to use the whole length in case of need not never use less than 2/3.

Never tighten the clamp in the spindle without the tool or with a mined or enlarged shank tool compared to the collet range.

FORTE SERRAGGIO POWER MILLING CHUCK

- Le scanalature realizzate all'interno del mandrino ne migliorano la rigidità e ne prevengono la deformazione. La grande forza di bloccaggio aumenta la precisione di run-out, permettendo di ottenere ottime finiture superficiali.
- Rigidity is strengthened through slot made at inside milling chuck, which prevents deformation of milling chuck. Smooth cutting is achieved by maximizing end mill clamping power.
- La solidità delle parti di bloccaggio previene le vibrazioni ed assicura minore usura utensile.
- Enough thickness of clamping part prevents chattering and ensures durability.

- Grazie alle strette tolleranze costruttive delle parti di bloccaggio, è possibile ottenere elevata precisione e rigidità.
- High precision can be achieved through accurate roundness of clamping part, deburred surface and rigidity.
- Run out non superiore a 0.01 (mm) con sporgenza $\leq 3XD$.
- Maintaining TIR not exceeding 0.01mm at 100mm from nose part.

- Ghiere costruite utilizzando un numero di cuscinetti superiori del 160% rispetto ad altri costruttori. Ciò consente di aumentare le forze di serraggio e di distribuire uniformemente il grande carico in fase di chiusura.
- 160% more of bearings are used in needle roller than other make's chucks, which provides strong clamping power and high durability by dispersing surface pressure even in case strong load is applied.

- Processi per aumentare l'affidabilità.
- In order to improve durability, SSK milling chuck is passed through following processes.
 - Normalizzazione, per togliere le tensioni interne al materiale.
 - "Normalizing" treatment for unifying material composition and removal internal stress.
 - Trattamento a bassa temperatura (-90°C), dopo cementazione, per eliminare deformazioni anche successivamente un lungo periodo di utilizzo.
 - Ultralow temperature (-90°C) treatment called "Sub-Zero treatment" after carburizing heat treatment for prior removal of any deformation of milling chuck after use for long periods of time.

Mandrini a forte serraggio per alta velocità - High Speed Milling Chuck

- Ottime prestazioni in operazioni di sgrossatura e finitura ad elevato numero di giri.
- Achieving optimum cutting for high-speed heavy duty cutting and finishing with strong torque power.

Utilizzo di chiavi standard To use ordinary spanner

Grado di bilanciatura Balancing Grade

G6.3/20,000(giri/min) - G6.3/20,000rpm

=> Azione di taglio ottimizzata in lavorazioni ad elevato numero di giri, sia in operazioni di sgrossatura che in operazioni di finitura.

=> Optimizing cutting effect during high-speed heavy duty cutting and finishing.

Conformazione interna del mandrino Slot design at inside milling chuck

- Aumenta la rigidità del mandrino.
- Strengthening body rigidity.
- Previene deformazioni durante la lavorazione.
- Preventing deformation during cutting.
- Massimizza la forza di serraggio.
- Maximizing torque power.
- Previene le vibrazioni ed assicura maggiore durata utensile.
- Preventing chattering and ensuring durability.

O Ring

- Previene infiltrazioni di materiale tra la ghiera e il corpo.
- Preventing foreign substances from entering body and nut.

Cuscinetti ad aghi Lots of needle bearings

- Maggior forza di bloccaggio.
- Strong load during clamping.
- Migliore distribuzione della pressione sulla superficie di bloccaggio.
- Dispersing surface pressure through needle bearing.

Mandrino ER maschiatore Tapping ER chuck

Mandrino maschiatore Tapping chuck

Il design compatto del mandrino riduce le interferenze

Minimizing tool interference during machining with short gauge line

Funzione di compensazione in tiro e spinta

Combining strength of strong torque power of ER chuck and tension and compression function of tapping chuck

Utilizzo pinze ER con quadro di trascinamento costi contenuti

Possible to change suitable tap for machining conditions by replacement of cheaper ER collet (Sharing collet with ER chuck)
-> Saving costs

Il sistema a cambio rapido incrementa gli ingombri e le interferenze

Interfered with tool during machining due to long gauge line

Funzione di compensazione tiro e spinta

Tension and compression function

Maggiore costo degli adattatori ma ridotti costi di sostituzione utensile

ALTA PRECISIONE

- L'elevata qualità costruttiva conferisce una eccellente precisione in rotazione.
Con l'ausilio della chiave la forza di serraggio aumenta di 3 volte rispetto al serraggio manuale.
